Time travel by moving through higher dimensions

In "Interstellar," advanced beings have created a "tesseract," a vessel where time is represented as a dimension of space. Cooper (Matthew McConaughey) can move in one direction to see the past and in the other direction to see the future. Cooper cannot interact with the past except via gravitational waves.

↳ save the world from the apocalypse

Traveling the space-time vortex

"Doctor Who's" (1963-present) TARDIS ("Time And Relative Dimension In Space") moves from one point in space and time to another by traveling through an extra-dimensional vortex. Travelers experience time passing normally within the TARDIS. Outside observers at the vortex see the TARDIS as a small object.

Einstein's wormhole theory for time travel
